Toda Y;

Bouwstra JB,

Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function. WPI; 2004-229415/22.

Example 1; SEQ ID NO 2; 31pp; English.

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-3. This is a trimer of human recombinant gelatin-like protein Hu-1 hDM48390. A claimed composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid osmotic function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kDa and at most 50 kDa and an isoelectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower clearance rate protein, is useful as a plasma expander that has a lower clearance rate clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin derivatives. Recombinant gelatin-like proteins that are in essence free of hydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically

active compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the interstitium. Clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, vasodilation, function of erythrocytes, thrombocytes and leukocytes, immune responses, and blood

The present sequence is the protein sequence of human recombinant gelatin-like polypeptide Hu-3, which has a molecular weight of approximately 54 kba and which contains multiple Gly-Xaa-Yaa triplets. In an example from the invention, recombinant Hu-3 was immobilised on polystyrene beads using a heterobifunctional crosslinking agent, and used in a spinner flask cell culture. A claimed process for the preparation of a cell culture support comprises the step of coating a microcarrier bead with gelatine or gelatine-like protein having a molecular weight of about 40-gelatine or gelatine-like protein having the step of immobilising the gelatine or gelatine-like protein on the microcarrier. In this process, more than 75%, preferably more than 85% and more preferably more than 85% and more preferably more than 85% and more preferably more than 95% of the gelatine or gelatine-like protein has the same molecular weight. The gelatine or gelatine-like protein has the same molecular weight.

The gelatine or gelatine-like protein is recombinately produced to obtain a material of uniform molecular weight and to reduce the risk of contamination with priorectate wegget and to feduce the fish of microbeads of 50-500 um size coated with a gelatine-like protein consisting of at least 95k Gly-Asa-Yaa triplets and containing at least 15k Gly-Asa-Yaa triplets and containing at least 15k foll-line residues and less than 5k of hydroxyproline residues, with a molecular weight distribution showing a maximum between 40 and 200 kba, at least 75k of the protein molecules having a molecular weight within 2k of the maximum. Large-scale production of expressed products can be accomplished with gelatine-coated microcarriers. Preparing cell culture support useful for culturing anchorage dependent cells, involves coating microcarrier bead with gelatine or gelatine-like protein having specific molecular weight. English ∺

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-1 ADM48390. A claimed composition suitable as a substitute for protein Hu-1 ADM48390. A claimed composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid composition. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kpa and at most 50 kba and an cost 50 kba and an coupled cost 50 kbarmace rate from blood samples containing 19 cost 50 kbarmace rate from the circulation containing 19 cost 50 kbarmaceutically active compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the circulating a more constant plasma level of the medicament. Peptides derived from the protien were used to demonstrate incorporation of 3,4-dehydro-1-prolline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3,4-dehydroprolline residue in the polypeptide with an epoxidation reagent from a polypeptide containing at least one 3,4-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Incorporating non-natural amino acid into polypeptide, useful e.g. for production of bioadhesives, by epoxidation or substitution of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3. hydroxyproline and is also useful and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional compensation of salso useful in scudying the structure and function of proteins contended is also useful in scudying the structure and function of proteins enguence represents human collagen (alphal) halical region, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQA 108

epoxyproline residue. The method is used for studying the effects of non-
natural amino acids on structure and function of polypeptides. The method
is also useful for commercial production of collagen or mussel adhesive
proteins (which are useful as bioadhesives), and for incorporating a wide
variety of groups, including therapeutic ligands and biological probes,
into polypeptides

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily characylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell for naturally occurring acodons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and conteating the nucleic acid sequence into the cell; and conteating the nucleic acid sequence into the cell; and conteating the nucleic acid sequence into the cell; and conteating the nucleic acid sequence into the cell; and conteating the nucleic acid sequence into the cell; and conteating the nucleic acid sequence of the anino acids to be assimilated hydroxyproline and incorporated into the extracellular matrix protein. The certombinant production of proteins. This is especially useful in the fibronomic production of proteins such as collagen, fibrinogen and fibronomic production of proteins such as collagen, fibrinogen and corporated on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of proteins expensent sequence represents a chimaria collagen (alphan)/decorin corporate in which may be produced using the method of the invention o ព Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful medical implants. The specification describes a method for producing an extracellular comparing the strategoration of the extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell; and the coll comparating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-contacting the cell with a comparated into the extracellular matrix protein. The into the cell and incorporated into the extracellular matrix protein. The cert of mathod may be used to make host cells assimilate and incorporate containing the septiment of production of proteins used in the comparation of proteins used in the cell and incorporated into the extracellular matrix protein. The recombinant production of proteins used produce functional proteins depends on the post translational hydroxylation of proteins depends on the post translational hydroxylation of proteins depends on the post translational hydroxylation of proteins depende represents chimeric collagen i (alphal)/transforming the present sequence represents chimeric collagen i (alphal)/transforming method of the immediate chimer which may be produced using the cells of the immediate collagen in which may be produced using the

```

The invention relates to the production of mammalian collagen in plants. CC clones: alpha3 and alpha22, spanning the human collagen type I gene were isolated from a NG-63 osteosarcoma library. Clone alpha3 contained cover isolated from a NG-63 osteosarcoma library. Clone alpha3 contained completed from a NG-63 osteosarcoma library. Clone alpha3 contained sequence encoding amino acids are 2 clones were used to generate a number of fragments which were used to construct composite sequences encoding variant collagen molecules. The fragments are: (A) containing nucleotides (In) - 4 to 479; (B) containing crocking the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding the pro-collagen and bases (B-77 from the sequence encoding and 1474-534) and the N-terminus of the mino propeptide domain (In 72-479); (D) all of the amino-telopeptide comain (In 72-479); (D) all of the amino-telopeptide domain (In 73-479); (D) all of the amino-telopeptide domain (In 73-479); (D) all of the central helicoidal domain (In 63-2808) of alpha22, encoding as 936-1192 in the central helicoidal domain (In 63-2808); (E) the Damilia (In 63-1464) plus stop codons, and (B) as G but the ER. This sequence represents a recombinant human collagen; (P) and (B). (E) the ER. This sequence represents a recombinant thum collagen in a shouterials (Mamostatic from fragments (A), (D), (B), (E), (E) and proteines for cardiac valves, ligaments or tendons of paramaceutical, weddical, odontological, cosmetic and biotechnological compositions (e.g. as prostheses for cardiac valves; ligaments of cultagen dystuction produced from the produce glues, 108 212 757 GVMGFPGPXGAAGEPGKAGERGVPGPPGAVGPAGXDGEAGAQGPPGPAGPAGERGEQGPA GSPGFQGLPGPAGPPGEAGKPGEQGVPGDLGAPGPSGPAGE------PGP---------TGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGFAGPKGSP GE-----AGREGEAGLEGAK-----GLIGSEGSEGFDGKIGFEGEAGDGRE GKDGVRGLTGP1GPPGPAGAPGDKGESGPSGPAGPTGARGAPGDRGEPGPPGPAGFAGPP 458 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGARGQA 1 GPP------GEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA Gaps Length 1464; 64.1%; Score 2237.5; DB 2; Length 1464; 60.2%; Pred. ```
method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      998 GPMGPPGLAGPPGESGKEGAPGAEGSPGRDGSPGAKGDRGETGPAGPPGAPGAPGAPGV 1057

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a ckit to perform the method, an array, a method for identifying an agent that is differentially expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the citivity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polypurcleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (cc) spin and spared nerve injury (CNI) in an animal (e.g. gene the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed printed in the function in the sequence of the sequence of the part of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                        Human; pain; neuronal tissue; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence which is differentially required in a naimal subjected to pain and a latt to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of a polynucleotide sequence which is differentially subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in na naimal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating specification, a method for identifying a compound useful in treating of pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CMI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form mark of the printed sequence data for this patent did not form mark of the printed sequence data for this patent did not form mark of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the

The present sequence is porcine alphal(I) collagen. The present invention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is useful in medical, paramaceutical, food and cosmetic incontinence implants, and for treating autoimmune disorders such as rheumatoid arthritis. Collagen is useful in food products such as sausage casings, and in cosmetics or facial and skin products such as sausage asings, and in cosmetics or facial and skin products such as sausage casings, and in cosmetics or facial and skin products such as sausage molisturisers. Recombinant gelatin is useful in vacious pharmaceutical and medical devices and products, in food and beverage industries, in hair medical devices and products, in food and beverage industries, in hair manufacturing processes, as a light-sensitive coating in various electronic devices, as photoresist base in photolithographic processes, in printing and photographic applications, in laboratory application, and as a component in various gels used for biochemical and electrophoretic analysis, including enzymographic gels and for treating autoimmune disorders, infections and cancer Example 3; Fig 8; 168pp; English.

```
New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              109 GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 168
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              275 GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 334
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     155 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               215 GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGPPGARGQA

```

The invention discloses a method for stimulating or inhibiting cell growth and/or division which comprises contacting or inserting into an animal cell a polypeptide comprising one of the deer antler cartilage cell (DACC) clones disclosed. More particularly, the method relates to these polypeptides stimulating mesenchymal cell growth and/or division and to transfecting these cells and chondrocytes with vectors carrying the genes of these polypeptides capable of stimulating chondrogenesis, osteogenesis, growth, repair, regeneration and/or restoration of the certacellular matrix. The chondrocytes selectively express genes required to form a cartilaginous matrix. The DACC polypeptides and polynucleotides are useful for identifying an agent that modulates the activity of the polypeptide, for stimulating mesenchymal cells growth and/or division by exposing animal mesenchymal cells to conditioned media or its active growth and/or division by inserting into an animal cell, a compound which inhibits the translation of the polynucleotide encoding the DACC. The method and the polypeptides are useful for stimulating mesenchymal cell growth midlo or division of the polynucleotide encoding the DACC. The inhibits the translation of the polynucleotide encoding the DACC. The conditions of the polynucleotide encoding the method and antagonists and animal. The polynucleotides, polypeptides, agonists and antagonists or animal. The polynucleotides, polypeptides, agonists and antagonists of dentify other proteins, which bind to or interact with the polynucleotides and are involved in modulating cell growth and/or division.

The sequences presented in ABG99923-ABG99848 are the proteins encoded by the DACC cDNA clones Stimulating or inhibiting cell growth and/or division, useful for stimulating chondrogenesis, cartilage, disc or connective tissue growth, repair, and/or regeneration, comprises administering deer antler Claim 13; Page 154-160; 214pp; English cartilage gene

levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as contraceptive, treating osteoporosis and osteoarthritis, anaemia, allabelmer's Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allargy, asthma, graftversus-host disease, ecema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The present sequence represents a protein of the invention

```
The invention relates to polynucleotides encoding novel human proteins or raised against the polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight are used to identify compounds which bind to the polypeptides are used to identify compounds which bind to the polypeptides or below of polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulgant; antiarthritic; cerebroprotective; antifungal; antiviral; antibacterial; antiallergic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; Parkinson's disease; inflammatory disorder; cancer; asthma; osteoporossis; tissue regeneration; immune disorder.

Sequence 20, Application US/08963825;
Patent No. 6110689
Patent No. 6110689
GENERAL INPORMATION:
APPLICANT: Qvist, Per
APPLICANT: Qvist, Per
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
TITLE OF INVENTION: Disorders Associated with the Metabolism of

Patent No. 632314
GENERAL INFORMATION:
APPLICANT: Ovist, Per
APPLICANT: Bonde, Martin
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for
TITLE OF INVENTION: Method and Use of the Method to Diagnose of TITLE OF INVENTION: Disorders Associated with the Metabolism of NUMBER OF SEQUENCES: 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           616

OPERATING SYSTEM: PC-DOS/MS-DOS
SOCTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/10/104,889
FILING DATE: 22-Mar-2002
CLASSIFICATION NUMBER: US/09/169,768
FILING DATE: 09-OCT-1998
ATTORNEY/AGENT INFORMATION:
NAME: STEEN, USFREY S
TELEPHONE: (516) 228-8816
TELEPHONE: (516) 228-8816
TELEPHONE: (516) 228-8816

INFORMATION FOR SEQ ID NO: 10:
SEQUENCE CHARACTERISTICS:
LENGTH: 1388 amino acids
